

WE ARE NOT LOOKING FOR INNOVATIVE SOLUTIONS, WE FIND THEM!

The Austrian company ETHERMA is known for innovative and well-designed solutions in the field of electric heating. In 2021, the extensive range will be expanded to a new product range: With the new AQUA series for hot water preparation, ETHERMA is making another important step in the field of independent and sustainable living.

THE JUMP INTO WARM WATER.

The electric and solar-compatible instantaneous water heater AQUA WHE is suitable as a decentralized water source for the preparation of hot water in renovation and new buildings. No heat loss, short pipes, no storage medium required - there are many reasons that speak in favor of this form of hot water preparation. Especially in bathrooms that are not used continuously. Depending on the size selected, the AQUA WHE can supply a bathtub and a washbasin with hot water. If you want a temperature setting that is accurate to the degree, choose the AQUA WHL model with LCD graphic display. The high-quality instantaneous water heater also has a memory function and a maximum temperature lock.

Also new to this range: the pressure resistant AQUA WSP hot water storage for under-counter installation, which is optionally available with a five or ten liter tank. Thanks to the built-in 2,000 W heating element, the device impresses with an extremely short heat-up time. The strong inner container made of stainless-steel promises maximum safety and ensures that tedious maintenance work is no longer necessary.

ETHERMA HIGHLIGHTS 2021.

The AQUA WHP hot water heating pump rounds off the AQUA series and guarantees efficient central hot water preparation with the high-quality 254l tank in both new buildings and modernizations. In addition to the space-saving and restrained design, the product impresses above all with its integrated smart grid function. In this way, self-generated electricity can be optimally used by photovoltaic systems - perfect for use in the ETHERMA ZERO EMISSION HOME (more on this at www.zeroemissionhome.com).

FRAMELESS BEAUTY.

The popular LAVA® BATH 2.0 series has also been expanded. The new frameless infrared heating panel with towel rail, called LAVA® BATH PURE, is the best proof that elegant design and inexpensive product solutions do not have to be mutually exclusive. At first glance, the product impresses with its restrained design - the towel rail was deliberately chosen in the same color as the body with a coated steel layer. But the LAVA® BATH PURE infrared heating is also impressive when it comes to equipment, for example with the tried and tested ETHERMA Plug & Play system for individual control. The infrared heating for the bathroom is available in three sizes and in the colors white and nano-anthracite.

WHEN PROVEN BECOMES EVEN BETTER.

The popular ETHERMA eTWIST rotary thermostat received a facelift and, as the new ETHERMA eTWIST BASIC, it will be even more user-friendly in terms of assembly and operation. The simple rotary thermostat can be controlled via Bluetooth and a free app on request and thus complies with the ECODESIGN guidelines. The rotary thermostat is also available in the two underfloor heating sets eFLOOR DS & LM BASIC. The self-regulating heating tapes eTRACE-10-PRO, eTRACE-15-PRO and eTRACE-25-PRO for pipe and gutter heating have been further developed for outdoor use and the new design is even more resistant to mechanical stress.

You can find more information about the ETHERMA range online at www.etherma.com as well as everything about our webinars. Our service team will be happy to answer any questions you may have at any time.
